

1. The other testing framework I looked at was another python testing framework called pytest.
2. It is very similar to unittest in the way it prints the results of the test. However, it can be run as just pytest in the command line and it will run all test_*.py and *_test.py files in the directory and sub directory which allows for easier group testing compared to what has been shown with unittest. The group testing seemed to be the only major difference between the two testing frameworks, the other differences were simply just differences in the words used to output successful and failed tests.
